Quantum Argument–Shift Subalgebras via Quantized Shift Operators

Yasushi Ikeda

Cracow University of Technology

February 13, 2026

Motivation 1 – Integrable Systems

Q-Shifts

Yasushi Ikeda

Motivation

Derivatives

Main

Formula

Generators

Let (M, π) be a Poisson manifold.

Integrable Systems

A central objective is to construct a sufficiently large Poisson-commutative family in $C^\infty M$.

A classical method to produce such families is the argument-shift construction of Mishchenko and Fomenko.

Theorem (A. Mishchenko and A. Fomenko, 1978)

Let ξ be a vector field on M with $\mathcal{L}_\xi^2 \pi = 0$. We have

$$\{\xi^m x, \xi^n y\} = 0, \quad \forall m, \forall n$$

for any Casimir functions x and $y \in C^\infty M$.

Motivation 2 – Deformation Quantization

Q-Shifts

Yasushi Ikeda

Motivation

Derivatives

Main

Formula

Generators

A deformation quantization of the Poisson manifold M is an $\mathbb{R}[[\nu]]$ -bilinear associative product on $(C^\infty M)[[[\nu]]]$ of the form

$$x \star y = xy + \frac{\nu\{x, y\}}{2} + \sum_{n=2}^{\infty} \nu^n B_n(x, y), \quad x, y \in C^\infty M,$$

where each B_n is a bidifferential operator. The first-order term recovers the Dirac correspondence rule

$$\{x, y\} = \left[\frac{x \star y - y \star x}{\nu} \right]_{\nu=0}.$$

Motivation 2 – Deformation Quantization

Q-Shifts

Yasushi Ikeda

Motivation

Derivatives

Main

Formula

Generators

Quantum Integrable Systems

A central objective is to construct a sufficiently large \star -commutative family in $(C^\infty M)[[\nu]]$.

Motivation

A quantized argument-shift construction (when it exists) is expected to yield commutation relations of the form

$$\left(\hat{\xi}^m x\right) \star \left(\hat{\xi}^n y\right) = \left(\hat{\xi}^n y\right) \star \left(\hat{\xi}^m x\right), \quad \forall m, \forall n$$

for any \star -central elements x and $y \in (C^\infty M)[[\nu]]$.

Quantum Partial Derivatives

Q-Shifts

Yasushi Ikeda

Motivation

Derivatives

Main

Formula

Generators

Let \mathfrak{g} be a finite-dimensional real Lie algebra.

1 The dual space \mathfrak{g}^* is a Poisson manifold.

$$\pi(x) = \sum_{i < j} \sum_{k=1}^d C_{ij}^k x_k \frac{\partial}{\partial x_i} \wedge \frac{\partial}{\partial x_j}.$$

2 Let ξ be an element of the Poisson manifold \mathfrak{g}^* . The vector field $\bar{\partial}_\xi$ in the direction ξ is given by

$$\bar{\partial}_\xi = \sum_{i=1}^d \xi(x_i) \frac{\partial}{\partial x_i} \equiv \sum_{i=1}^d \xi_i \bar{\partial}^i.$$

Quantum Partial Derivatives

Q-Shifts

Yasushi Ikeda

Motivation

Derivatives

Main

Formula

Generators

Consider a deformation quantization.

- The universal enveloping algebra $U\mathfrak{g}$ describes a deformation quantization of the Poisson manifold \mathfrak{g}^* at $\nu = 1$.
- The symmetric algebra $S\mathfrak{g}$ is the algebra of polynomial functions on the Poisson manifold \mathfrak{g}^* and the associated graded algebra of the universal enveloping algebra $U\mathfrak{g}$.
- It suffices to construct suitable quantum partial derivatives ∂^i in order to quantize the classical shift operator $\bar{\partial}_\xi$.
- Gurevich, Pyatov, and Saponov introduced such quantum partial derivatives ∂_j^i for $\mathfrak{g} = \mathfrak{gl}_d$.

Quantum Partial Derivatives

Q-Shifts

Yasushi Ikeda

Motivation

Derivatives

Main

Formula

Generators

We restrict to the case $\mathfrak{g} = \mathfrak{gl}_d$. Let e_j^i be the standard basis elements of \mathfrak{gl}_d and set

$$e = \begin{pmatrix} e_1^1 & \dots & e_d^1 \\ \dots & \dots & \dots \\ e_1^d & \dots & e_d^d \end{pmatrix}.$$

They satisfy the commutation relations

$$[e_{j_1}^{i_1}, e_{j_2}^{i_2}] = \delta_{j_2}^{i_1} e_{j_1}^{i_2} - \delta_{j_1}^{i_2} e_{j_2}^{i_1}.$$

We define an operator on the symmetric algebra $S\mathfrak{gl}_d$

$$\bar{\partial}_x = \begin{pmatrix} \bar{\partial}_1^1 x & \dots & \bar{\partial}_d^1 x \\ \dots & \dots & \dots \\ \bar{\partial}_1^d x & \dots & \bar{\partial}_d^d x \end{pmatrix}, \quad \bar{\partial}_j^i = \frac{\partial}{\partial e_j^i}.$$

Quantum Partial Derivatives

Q-Shifts

Yasushi Ikeda

Motivation

Derivatives

Main

Formula

Generators

Remark

The partial derivatives

$$\mathrm{Sgl}_d \rightarrow \mathrm{Sgl}_d, \quad x \mapsto \bar{\partial}_j^i x$$

are the unique linear mappings satisfying the following.

- 1 $\bar{\partial} \nu = 0$ for any scalar ν .
- 2 $\bar{\partial} \mathrm{tr}(\xi e) = \xi$ for any numerical matrix ξ .
- 3 (Leibniz rule)

$$\bar{\partial}(xy) = (\bar{\partial}x)y + x(\bar{\partial}y)$$

for any elements x and y of Sgl_d .

Quantum Partial Derivatives

Q-Shifts

Yasushi Ikeda

Motivation

Derivatives

Main

Formula

Generators

- There are no such derivations of $U\mathfrak{gl}_d$ since $U\mathfrak{gl}_d$ is noncommutative: the Leibniz rule implies

$$\partial\left(e_{j_1}^{i_1}e_{j_2}^{i_2} - e_{j_2}^{i_2}e_{j_1}^{i_1}\right) = 0,$$

while $\partial\left(\delta_{j_2}^{i_1}e_{j_1}^{i_2} - \delta_{j_1}^{i_2}e_{j_2}^{i_1}\right) = \delta_{j_2}^{i_1}E_{j_1}^{i_2} - \delta_{j_1}^{i_2}E_{j_2}^{i_1} \neq 0$.

- One can modify the Leibniz rule and introduce well-defined quantum partial derivatives of $U\mathfrak{gl}_d$.

Quantum Partial Derivatives

Q-Shifts

Yasushi Ikeda

Motivation

Derivatives

Main

Formula

Generators

Definition (Gurevich, Pyatov, and Saponov, 2012)

The quantum partial derivatives

$$U\mathfrak{gl}_d \rightarrow U\mathfrak{gl}_d, \quad x \mapsto \partial_j^i x$$

are the unique linear mappings satisfying the following.

- 1 $\partial\nu = 0$ for any scalar ν .
- 2 $\partial \operatorname{tr}(\xi e) = \xi$ for any numerical matrix ξ .
- 3 (quantum Leibniz rule)

$$\partial(xy) = (\partial x)y + x(\partial y) + \boxed{(\partial x)(\partial y)}$$

for any elements x and y of $U\mathfrak{gl}_d$.

Quantum Partial Derivatives

Q-Shifts

Yasushi Ikeda

Motivation

Derivatives

Main

Formula

Generators

Remark

The linear operator

$$U\mathfrak{gl}_d \rightarrow M_d(U\mathfrak{gl}_d), \quad x \mapsto \text{diag}(x, \dots, x) + \partial x \equiv Dx$$

is a unital algebra homomorphism by the quantum Leibniz rule.

- Equivalently,

$$D = (\text{id} \otimes \rho) \circ \Delta,$$

where Δ denotes the comultiplication on $U\mathfrak{gl}_d$ and $\rho: U\mathfrak{gl}_d \rightarrow M_d$ is the extension of the standard representation of \mathfrak{gl}_d on \mathbb{C}^d .

- We may define the quantum partial derivatives ∂_j^i either explicitly or using the homomorphism $D = (\text{id} \otimes \rho) \circ \Delta$.

Main Theorem

Q-Shifts

Yasushi Ikeda

Motivation

Derivatives

Main

Formula

Generators

Suppose ξ is a numerical matrix and let $D_\xi = \text{tr}(\xi D)$. The following is our main theorem.

Theorem (I. and Sharygin, 2024)

$\bigcup_{n=0}^{\infty} \{ D_\xi^n x : x \text{ is central} \}$ is a commuting family.

- We may assume that ξ is diagonal with diagonal entries (z_1, \dots, z_d) mutually distinct since such matrices with their conjugates form a dense subset of M_d .
- Vinberg and Rybnikov showed that the centralizer of

$$\left\{ e_i^j, \sum_{j \neq i} \frac{e_i^j e_j^i}{z_i - z_j} \right\}_{i=1}^d$$

is a commutative subalgebra of Ugl_d .

Main Theorem

Q-Shifts

Yasushi Ikeda

Motivation

Derivatives

Main

Formula

Generators

- The proof is carried out by showing that the quantum shift $\partial_\xi^n x$ commutes with these elements by induction on n .
- It reduces to proving

$$\left[\sum_{j \neq i} \frac{e_i^j e_j^i}{z_i - z_j}, D_\xi x \right] = 0, \quad \left[\left[\text{ad} \sum_{j \neq i} \frac{e_i^j e_j^i}{z_i - z_j}, D_\xi \right], D_\xi \right] = 0.$$

- The second condition can be verified by direct computation.
- The first condition reduces to computing the first-order quantum shift of an arbitrary central element.

Formula

Q-Shifts

Yasushi Ikeda

Motivation

Derivatives

Main

Formula

Generators

We compute the quantum shifts $D_\xi^n x$ for an arbitrary central element x . The center C of $U\mathfrak{gl}_d$ is a free commutative algebra generated by

$$\operatorname{tr} e, \quad \dots, \quad \operatorname{tr} e^d.$$

They are the Gelfand invariants. It is necessary and even sufficient to compute the quantum partial derivatives $D(e^n)_j^i$.

Formula

Q-Shifts

Yasushi Ikeda

Motivation

Derivatives

Main

Formula

Generators

I obtained the following formula for the quantum partial

derivatives. Define $f_{\pm}^{(n)}(x) = \sum_{m=0}^n \frac{1 \pm (-1)^{n-m}}{2} \binom{n-1}{m} x^m$.

Theorem (I, 2022)

We have

$$\begin{aligned} D(e^n)_j &= \sum_{m=0}^n (f_+^{(n-m)}(e)(e^m)_j + f_-^{(n-m)}(e)_j(e^m)_i) \\ &= \sum_{m=0}^n ((e^m)_j f_+^{(n-m)}(e) + (e^m)_j f_-^{(n-m)}(e)_i) \end{aligned}$$

for any nonnegative integer n .
