The main theorem of my talk is the following:

## Theorem (I. and Sharygin, 2024)

*Assumptions:*

- $x$  and  $y$ : central elements of the universal enveloping algebra  $U\mathfrak{gl}_d$ .
- $\xi$ :  $d \times d$  numerical matrix.

Then  $[\partial_\xi^m x, \partial_\xi^n y] = 0$  for any  $m$  and  $n$ .

Here,

- $\partial_\xi = \text{tr}(\xi \partial)$  and  $\partial_j^i \in \text{hom } U\mathfrak{gl}_d$ : the **quantum derivation** introduced by Gurevich, Pyatov, and Saponov.

# Symmetric and Universal Enveloping Algebras

Q-Shifts

Yasushi Ikeda

Statement

Motivation

Motivation

Derivation

Formula

Generators

Conclusions

- Roughly speaking, the symmetric algebra gives classical descriptions and the universal enveloping algebra gives quantum descriptions of a Lie algebra.
- Suppose that  $(e_1, \dots, e_d)$  is a basis of a finite dimensional complex Lie algebra  $\mathfrak{g}$  and let

$$T\mathfrak{g} \simeq \mathbb{C}\langle e_1, \dots, e_d \rangle$$

denote its tensor algebra.

# Symmetric Algebra

Q-Shifts

Yasushi Ikeda

Statement

Motivation

Motivation

Derivation

Formula

Generators

Conclusions

The symmetric algebra  $S\mathfrak{g}$  is a quotient algebra of the tensor algebra  $T\mathfrak{g}$  by the ideal generated by

$$\{x \otimes y - y \otimes x : x, y \in \mathfrak{g}\}.$$

That is,

$$\begin{aligned} S\mathfrak{g} &= T\mathfrak{g} / (x \otimes y - y \otimes x : x, y \in \mathfrak{g}) \\ &\simeq \mathbb{C}[e_1, \dots, e_d]. \end{aligned}$$

The symmetric algebra  $S\mathfrak{g}$  is a *commutative* algebra.

# Universal Enveloping Algebra

Q-Shifts

Yasushi Ikeda

Statement

Motivation

Motivation

Derivation

Formula

Generators

Conclusions

The universal enveloping algebra  $U\mathfrak{g}$  is a quotient algebra of the tensor algebra  $T\mathfrak{g}$  by the ideal generated by

$$\{x \otimes y - y \otimes x - [x, y] : x, y \in \mathfrak{g}\}.$$

That is,

$$U\mathfrak{g} = T\mathfrak{g} / (x \otimes y - y \otimes x - [x, y] : x, y \in \mathfrak{g}).$$

The universal enveloping algebra  $U\mathfrak{g}$  is a *non-commutative* algebra (if the Lie bracket of  $\mathfrak{g}$  is non-trivial).

# Deformation Quantization

Q-Shifts

Yasushi Ikeda

Statement

Motivation

Motivation

Derivation

Formula

Generators

Conclusions

In mathematics, it is well-known that the dual space  $\mathfrak{g}^*$  of the Lie algebra  $\mathfrak{g}$  is a Poisson manifold:  $\mathfrak{g} \subset S\mathfrak{g} \subset C^\infty \mathfrak{g}^*$ .

- Lie algebra  $\mathfrak{g} = \mathfrak{g}^{**}$ : linear functions on  $\mathfrak{g}^*$ .
- Symmetric algebra  $S\mathfrak{g}$ : polynomial functions on  $\mathfrak{g}^*$ .
- Smooth functions algebra  $C^\infty \mathfrak{g}^*$ : smooth functions on  $\mathfrak{g}^*$ .

Consider a deformation quantization of  $C^\infty \mathfrak{g}^*$ .

$$\begin{array}{ccc} C^\infty \mathfrak{g}^* \times C^\infty \mathfrak{g}^* & \xrightarrow{\star} & (C^\infty \mathfrak{g}^*)[[\nu]] \\ \uparrow & & \uparrow \\ S\mathfrak{g} \times S\mathfrak{g} & \xrightarrow{\star} & (S\mathfrak{g})[\nu] \end{array}$$

# Deformation Quantization

Q-Shifts

Yasushi Ikeda

Statement

Motivation

Motivation

Derivation

Formula

Generators

Conclusions

## Remark

The image of the restriction of the appropriate star product on  $S\mathfrak{g} \times S\mathfrak{g}$  is contained in the polynomial algebra  $(S\mathfrak{g})[\nu]$ .

- It makes sense to put  $\nu = 1$  and obtain the star product on the symmetric algebra  $S\mathfrak{g}$ .
- *The universal enveloping algebra  $U\mathfrak{g}$  is isomorphic to the symmetric algebra  $S\mathfrak{g}$  with the star product at  $\nu = 1$ .*
- We have  $\boxed{S\mathfrak{g} = \text{gr } U\mathfrak{g}}$ .

# Prior Research and Motivation

Q-Shifts

Yasushi Ikeda

Statement

Motivation

Motivation

Derivation

Formula

Generators

Conclusions

Take a basis  $(e_n)_{n=1}^d$  of  $\mathfrak{g}$  and let

$$\bar{\partial}_\xi = \sum_{n=1}^d \xi(e_n) \frac{\partial}{\partial e_n} \in \text{der } S\mathfrak{g}$$

be the directional derivative along  $\forall \xi \in \mathfrak{g}^*$ . Let  $\bar{\mathcal{C}}$  be the Poisson center of  $S\mathfrak{g}$ . The following theorem is referred to as the argument shift method.

**Theorem (A. Mishchenko and A. Fomenko, 1978)**

*The subset  $\left\{ \bar{\partial}_\xi^n x : (n, x) \in \mathbb{N} \times \bar{\mathcal{C}} \right\}$  is Poisson commutative.*

# Prior Research and Motivation

Q-Shifts

Yasushi Ikeda

Statement

Motivation

Motivation

Derivation

Formula

Generators

Conclusions

- We obtain a  $\boxed{\text{Poisson commutative}}$  subalgebra  $\overline{C}_\xi$  generated by these elements  $\overline{\partial}_\xi^n x$ .
- Recall  $\boxed{\text{gr } U\mathfrak{g} = S\mathfrak{g}}$ .
- Vinberg asked if the argument shift algebra  $\overline{C}_\xi$  can be quantised to a  $\boxed{\text{commutative}}$  subalgebra  $C_\xi$  of the universal enveloping algebra  $U\mathfrak{g}$  in a way that  $\boxed{\text{gr } C_\xi = \overline{C}_\xi}$ .
- Such  $C_\xi$  is called a quantum argument shift algebra.

# Prior Research and Motivation

Q-Shifts

Yasushi Ikeda

Statement

Motivation

Motivation

Derivation

Formula

Generators

Conclusions

- **Vinberg's problem** has been resolved in two ways:
  - Twisted Yangians: Nazarov–Olshanski.
  - Symmetrisation mapping: Tarasov.
- Also resolved using the Feigin–Frenkel center:
  - for regular elements  $\xi$ : Feigin et al. and Rybnikov.
  - for simple Lie algebras of types A and C: Futorny–Molev and Molev–Yakimova.

## Motivation

The purpose of my talk is to quantize not only the algebra  $\overline{\mathcal{C}}_\xi$  but also the **operator**  $\overline{\partial}_\xi$ .

## Definition (Gurevich, Pyatov, and Saponov, 2012)

The quantum derivation

$$U\mathfrak{gl}_d \rightarrow M(d, U\mathfrak{gl}_d), \quad x \mapsto \partial x$$

is a unique linear mapping satisfying the following.

- 1  $\partial\nu = 0$  for any scalar  $\nu$ .
- 2  $\partial \operatorname{tr}(\xi e) = \xi$  for any numerical matrix  $\xi$ .
- 3 (quantum Leibniz rule)

$$\partial(xy) = (\partial x)y + x(\partial y) + (\partial x)(\partial y)$$

for any elements  $x$  and  $y$  of the universal enveloping algebra  $U\mathfrak{gl}_d$ .

# Quantum Derivation

Q-Shifts

Yasushi Ikeda

Statement

Motivation

Motivation

Derivation

Formula

Generators

Conclusions

Let  $C$  be the center of the algebra  $U\mathfrak{gl}_d$ . Suppose that  $\xi$  is a numerical matrix and let  $\partial_\xi = \text{tr}(\xi\partial)$ . The main theorem is the following:

## Theorem (I. and Sharygin, 2024)

*The subset*

$$\left\{ \partial_\xi^n x : (n, x) \in \mathbb{N} \times C \right\} \quad (1)$$

*is commutative.*

## Corollary

*The subalgebra  $C_\xi$  generated by the subset (1) is the quantum argument shift algebra in the direction  $\xi$ .*

# Quantum Derivation

## Q-Shifts

Yasushi Ikeda

Statement

Motivation

Motivation

Derivation

Formula

Generators

Conclusions

- We may assume that  $\xi = \text{diag}(z_1, \dots, z_d)$  is diagonal and  $(z_1, \dots, z_d)$  is distinct considering the adjoint action of the general linear Lie group  $GL_d$ .
- Vinberg and Rybnikov showed that the quantum argument shift algebra in the direction  $\xi$  is the centralizer of the set

$$\left\{ e_i^j, \sum_{j \neq i} \frac{e_i^j e_j^i}{z_i - z_j} \right\}_{i=1}^d. \quad (2)$$

- Since, by definition, the quantum argument shift algebra is commutative, the proof is carried out by showing that the quantum argument shift  $\partial_\xi^n x$  commutes with the elements (2) by induction on the natural number  $n$ .

# Formula

Q-Shifts

Yasushi Ikeda

Statement

Motivation

Motivation

Derivation

Formula

Generators

Conclusions

The center  $C$  of the algebra  $U\mathfrak{gl}_d$  is the free commutative algebra on the elements

$$\mathrm{tr} e, \quad \dots, \quad \mathrm{tr} e^d.$$

They are called the Gelfand invariants. We would like to calculate the quantum argument shift  $\partial_\xi^n x$  for a central element  $x$ . It is necessary and even sufficient to calculate the quantum derivation  $\partial(e^n)_j^i$ .

# Formula

Generators

Conclusions

## Remark

The linear operator

$$Ugl(d, \mathbb{C}) \rightarrow M(d, Ugl(d, \mathbb{C})), \quad x \mapsto \text{diag}(x, \dots, x) + \partial x$$

is an algebraic homomorphism and **will be denoted by  $\partial$**  from now on. We have the *quantum Leibniz rule*

$$\partial(xy) = (\partial x)(\partial y)$$

for any elements  $x$  and  $y$  of the universal enveloping algebra  $Ugl(d, \mathbb{C})$ .

# Formula

Q-Shifts

Yasushi Ikeda

Statement

Motivation

Motivation

Derivation

Formula

Generators

Conclusions

I obtained the following formula for the quantum derivation.

We define  $f_{\pm}^{(n)}(x) = \sum_{m=0}^n \frac{1 \pm (-1)^{n-m}}{2} \binom{n-1}{m} x^m$ .

## Theorem (I, 2022)

*We have*

$$\begin{aligned} \partial(e^n)_j^i &= \sum_{m=0}^n (f_+^{(n-m)}(e)(e^m)_j^i + f_-^{(n-m)}(e)_j(e^m)^i) \\ &= \sum_{m=0}^n ((e^m)_j^i f_+^{(n-m)}(e) + (e^m)_j f_-^{(n-m)}(e)^i). \end{aligned}$$

The formula is used for the base case.

# Formula

## Q-Shifts

Yasushi Ikeda

Statement

Motivation

Motivation

Generators

Conclusions

- We consider a representation of another Lie algebra and obtain a quantum derivation/quantum argument shift operator. However, this naive operator does not satisfy the quantized argument shift method. This means that I still do not know the appropriate definition of the quantum derivation/quantum argument shift operator in the general case.
- It may be more promising to generalize this result to the general linear Lie superalgebra  $\mathfrak{gl}_{m|n}$ . I am currently working on this.
- By encoding quantum information in the joint eigenspaces of a family of matrices arising from representations of these commuting elements, we may be able to develop a new error-correction scheme.
